plants with improved properties. New isolated Coix regulatory sequences, used for producing transgenic

Claim 32; Page 228-229; 238pp; English.

The present sequence represents the promoter of the gamma-coixin gene. The promoter is used in the method of the invention. The specification describes a method of preparing a monocotyledonous plant (other than Coix sp.) expressing a selected gene. The method comprises transforming a plant cell with construct comprising a selected gene operably linked to a

The method can be used to prevent gene silencing in a monocotyledonous plant. The methods can be used for transforming monocot plants such as rice, wheat, oats, barley, rye, sorghum and maize. They can be transformed with genes such as an insect resistance gene, a fungal disease resistance gene, a viral disease resistance gene, a bacterial disease resistance gene, a herbicide resistance gene, a gene affecting grain composition or quality, a nutrient utilization gene, a mycotoxin reduction gene, a mele sterility gene, a selectable marker gene, a sereenable marker gene, a gene affecting plant agronomic characteristics, and an environment or stress resistance gene. The methods can also be used for producing transgenic dicot plants such as tobacco, tomato,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        361

describes a method of preparing a monocotyledonous plant (other than Coix gp.) expressing a selected gene. The method comprises transforming a CC plant cell with construct comprising a selected gene operably linked to a CC coix promoter, and then regenerating a monocotyledonous plant which CC expresses the gene from the recipient cell. The method can be used to CC prevent gene silencing in a monocotyledonous plant which CC used for transforming monocotyledonous plant. The methods can be CC used for transforming monocotyledonous plant. The methods can be CC used for transforming monocotyledonous plant. The methods can be consistence gene, a fungal disease resistance gene, a viral disease resistance gene, a viral disease resistance gene, a viral disease contribution or quality.

CC resistance gene, a gene affecting grain composition or quality.

CC gene, a selectable marker gene, a mycotoxin reduction gene, a megative gene, a selectable marker gene, a gene affecting plant agronomic characteristics, and an environment or stress resistance gene. The methods can also be considered to stress resistance gene. The methods can also be considered to stress resistance gene. The methods can also be considered to stress resistance gene.
                                                             8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁

The present sequence represents a fragment of the gamma-coixin promoter. The promoter is used in the method of the invention. The specification describes a method of preparing a monocotyledonous plant (other than Coix sp.) expressing a selected gene. The method comprises transforming a plant cell with construct comprising a selected gene operably linked to a Coix promoter, and then regenerating a monocotyledonous plant which

The method can be used to prevent gene silencing in a monocotyledonous plant. The methods can be used for transforming monocot plants such as rice, wheat, oats, barley, rye, sorghum and maize. They can be transformed with genes such as an insect resistance gene, a fungal disease resistance gene, a viral disease resistance gene, a bacterial disease resistance gene, a herbicide resistance gene, a gene affecting grain composition or quality, a nutrient utilization gene, a mycotoxin reduction gene, a male sterility gene, a selectable marker gene, a sfeeting plant agronomic characteristics, and an environment or stress resistance gene. The methods can also be used for producing transgenic dicot plants such as tobacco, tomato, potents of the stress resistance gene.
                                                                                                                                                                                                                                                                                                                   Sequence

```
The present invention describes polynucleotides which encode processing cc enzymes (e.g. alpha-amylase, pullulanase, alpha-glucosidase, glucose cc isomerase, or glucoamylase) that are optimised for expression in plants. CC The polynucleotides encode mesophilic, thermophilic or hyperthermophilic processing enzymes, which are activated under suitable conditions to act compose the desired substrate. Also described are self-processing transgenic cc plants and plant parts, e.g. grain, which express one or more of these cenzymes and have an altered composition that facilitates plant and grain cc enzymes and have an altered composition that facilitates plant and grain cc plants and processing. Also described is a method (M) for converting starch to cc the starch processing enzyme contained in it. Transgenic grain is useful cf or preparing maltodextrin. A transformed plant part (TPP), by activating cc produce food products having improved taste and to produce fermentable composition of the present severages. (M) eliminates the need composition of starch-derived products. The present sequence represents a cc maize gamma-zein promoter nucleic acid sequence, which is given in the cc exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                             á
                                                                                                                    밁
                                                                                                                                                  á
                                                                                                                                                                                                                                                                                            The invention relates to a method for preparing a thermotolerant phytase. CC The method comprises expressing in a plant cell an expression cassette CC comprising a promoter operably linked to a nucleic acid molecule encoding a thermotolerant phytase which retains at least 40% activity after 30 CC minutes at 60plusoC and has a specific activity of greater than 200 U/mg at pH 4.5 and 37plusoC. The method is useful for preparing a thermotolerant phytase for preparing animal feed or human food. The CC invention is useful for reducing the feed conversion ratio and increasing weight gain, improving reducing feed conversion rations or increasing CC weight gain of animals fed diets with inorganic phosphate at levels below 0.45%, minimising dietary requirements of phosphorus in an animal, CC enhancing the utilisation of phosphorus present in animal feed, enhancing corganic phosphorus utilisation from organic phosphorus sources in animal (CC feed, decreasing the phosphate levels in excreta from an animal, CC improving the processing of grain, improving the nutritive value of utrainive value of animal feed and human food, and preparing a cC transformed plant which expresses a thermotolerant phytase. The present sequence is maize gamma zein promoter DNA used in the exemplification of the invention
                                                                                                                                                                                        Matches 430;

The DNA construct is useful for producing transgenic maize plants that express high quantities of the 10 kilodalton methionine rich zein seed storage protein. Overexpression of the zein storage protein in maize seeds increases the capture of free methionine during plant maturation, which otherwise would be lost. The transgenic plants are superior to prior ar natural high-methionine variants because they consistently express the kilodalton transgene regardless of the drzl allelic composition of the

The DNA construct is useful for producing transgenic maize plants that express high quantities of the 10 kilodalton methionine rich zein seed storage protein. Overexpression of the zein storage protein in maize seeds increases the capture of free methionine during plant maturation, which otherwise would be lost. The transgenic plants are superior to prior art natural high-methionine variants because they consistently express the 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA construct used for producing transgenic maize plants that express high quantities of 10 kilodalton zein seed storage protein encodes de zein operably linked to promoter and to sequence encoding modified 3'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  27-AUG-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ₽
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ś
         The present invention describes a transformed cereal plant seeds CC endosperm having an elevated level of at least one preselected amino acid CC (aa) compared to a seed from a corresponding untransformed plant, where the aa is selected from lysine, cysteine, threonine, tryptophan, CC arginine, valine, leucine, isoleucine, histidine or their combinations, CC arginine, valine, leucine, isoleucine, histidine or their combinations, CC arginine, valine, leucine, isoleucine, histidine or their combinations, CC and optionally methionine. Plants transformed to express a heterologous cricreased to grow seeds, especially cereals, that have an endosperm with an CC used to grow seeds, especially cereals, that have an endosperm with an CC increased content of the preselected amino acid, and therefore having an increased nutritional value. The transformed cereals can be used in feed formulations for animals. Transforming plants to have an elevated level CC of a preselected amino acid in the endosperm of its seed is advantageous in production of feed formulations. Feed formulations currently require supplementation with specific amino acids to provide animals with CC essential nutrients, which are necessary for their growth. The methods increase the nutritional content of seeds without detrimental side cutficets such as allergenicity or anti-nutritional quality. The content of the seeds is increased whilst maintaining a high CC cryanomic plant to about 10 times greater compared to a corresponding variation acid in the seed is increased at CC care as 10-20% by weight to about 10 times greater compared to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Jung R,

                                                    of a preselected amino acid in the endosperm of its seed is advantageous in production of feed formulations. Feed formulations currently require supplementation with specific amino acids to provide animals with essential nutrients, which are necessary for their growth. The methods increase the nutritional content of seeds without detrimental side effects such as allergenicity or anti-nutritional quality. The nutritional content of the seeds is increased whilst maintaining a high yield. The amount of preselected amino acid in the seed is increased at least 10-20% by weight to about 10 times greater compared to a corresponding untransformed seed. The present sequence represents a chimeric gene construct gene, which is derived from the barley (Hordeum vulgare) alpha hordothionin gene and introduces 12 lysine residues into
                                                                                                                                                                                                                                                                                                                                       The present invention describes a transformed cereal plant seeds endosperm having an elevated level of at least one preselected amino acid (aa) compared to a seed from a corresponding untransformed plant, where the aa is selected from lysine, cysteine, threonine, tryptophan, arginine, valine, leucine, isoleucine, histidine or their combinations, and optionally methionine. Plants transformed to express a heterologous protein that has an elevated content of a preselected amino acid can be used to grow seeds, especially cereals, that have an endosperm with an increased content of the preselected amino acid, and therefore having an increased nutritional value. The transformed cereals can be used in feed formulations for animals. Transforming plants to have an elevated level of a preselected amino acid, and therefore having an increased mutritional value. The transformed cereals can be used in feed formulations for animals. Transforming plants to have an elevated level of a preselected amino acid, and therefore having an increased mutritional value.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Plant seeds containing

Higgins
The present invention describes a transformed cereal plant seeds endosperm having an elevated level of at least one preselected amino acideal compared to a seed from a corresponding untransformed plant, where the aa is selected from lysine, cysteine, threonine, tryptophan, arginine, valine, leucine, isoleucine, histidine or their combinations, and optionally methionine. Plants transformed to express a heterologous protein that has an elevated content of a preselected amino acid can be
